Genome Enhancer release 3.4 (GKDB version 20.0, CIViC version 01 October 2022)

MTB Report - From somatic variants to treatment options

GENE-DRUG PREDICTIVE ASSOCIATIONS

This report is based on the following genomics data, which was submitted for the current study in the Genome Enhancer pipeline:

NCI-H1975
NCI-H1975

Annotation diagram of experimental data used in the study.

The studied pathologies, which were selected during the Genome Enhancer analysis launch, were *Carcinoma*, *Non-Small-Cell Lung* and *Lung Neoplasms*. These diseases match the following pathologies, which were used as the input parameters for the [Molecular Tumor Board \(MTB\)](#) method to produce this report: *Lung cancer*.

The [Variant Effect Predictor](#) analysis was applied to the input vcf track, which was submitted for the analysis in the *NCI-H1975* condition. All mutations, which were found in the studied data in comparison to the reference genome, were annotated with the predicted effects. The gene-drug predictive associations were further retrieved with the use of the [MTB method](#).

Gene-drug predictive associations method used in the MTB report: somatic variants of the studied input data (mutations, amplifications, deletions, rearrangements) were searched in curated databases of predictive biomarkers ([GKDB](#), [CIViC](#)) and reported according to their clinical evidence (Levels of Evidence).

Levels of Evidence: Findings are classified into six levels of evidence combining the axis A-B and the axis 1-2-3. Level A means evidence was found in the same cancer type as the one being studied. Level B means evidence was found in any other cancer type. On the 1-2-3 axis, level 1 means the evidence is supported by drug approval organizations or clinical guidelines, level 2 contains a clinical evidence (clinical trials, case reports) and level 3 consists of a preclinical evidence.

The report summarizes all predictive associations in a detailed table. The results are sorted by the level of evidence (A1-B1-A2-B2-A3-B3). To allow a quick interpretation, the type of the association (response, resistance) is colored (green, red) and new variants are displayed in gray.

Table 1. Report for Lung cancer

Gene	Variant	Disease	Known Variant	Association	Drugs	Evidence	PMID	Level
EGFR	L858R	Lung Acinar Adenocarcinoma	L858R (GoF)	response	erlotinib	FDA-approved	FDA	A1
